

Startup Project Proposal

VENTURE QUALIFICATION & GATE SUBMISSION

Gate Reference: STAGE-1 LOCK

PROJECT NAME
Mix-Trendz

LEAD FOUNDER
Sandes Thameesha

SUBMISSION DATE
September 30, 2026

1. PROBLEM STATEMENT & DOMAIN

≤ 150 Words

Consumers rarely choose fashion aligned with their true identity; instead, they select from what retail inventory happens to be in stock. Because apparel is not curated to match individual body shapes, skin tones, and visual personalities, customer confidence and self-presentation suffer silently. The modern fashion e-commerce domain lacks a personalized digital bridge connecting real physical attributes with curated retail offerings.

2. SPECIFIC TARGET USER

ICP Focus

Ideal Customer Profile (ICP): Trend-conscious individuals (ages 18–35, middle-to-upper income) who struggle to find flattering styles tailored to their physical build. Specifically targeting urban professionals and youth who value personal presentation and social standing, but lack personal styling expertise or time to navigate disparate brand catalogs.

3. VALIDATION STRATEGY (ROUTE A / B)

≤ 300 Words

People often judge others based on appearance, so outfits play a major role in defining personality and social status. Most middle-class people want to enhance their social status, and among the many things they do to show it, their outfits do a huge part of the job. Secondly, there are people with different body shapes - fat, short, slim and others - who do not know how to choose suitable outfits to improve their look according to trending styles. Therefore, I want to create a platform where each customer has their own profile that includes their height, weight, face shape, body shape, favorite fashion style, favorite colors, favorite clothing brands, and all the information needed to create a perfect profile avatar to understand their preferences. After that, our application will create a virtual avatar for the customer, which they can customize using our platform with AI suggestions provided according to their profile. Then, they can choose items one by one and buy them all at once in the same place with a clear idea of what they are going to wear. We can link the most famous clothing brands and other developing brands who want to fulfill customer needs and increase their sales.

Mix-Trendz Project Proposal

4. MARKET SIZING (TAM / SAM / SOM)

Metrics & Assumptions

Metric	Market Value (\$)	Key Assumptions & Data Sources
TAM Total Addressable	\$400M – \$500M / yr	Overall Sri Lankan retail apparel and digital commerce market size (~13.9M internet users with fashion as a primary online category). <i>Source: Statista & ECDB Market Insights.</i>
SAM Serviceable Addressable	\$50M – \$80M / yr	Urban, tech-enabled online fashion consumers (ages 18–35) in major Sri Lankan urban centers actively purchasing online.
SOM Serviceable Obtainable	\$1.0M – \$1.5M / yr	Capturing 10,000 active users in Year 1–2 assuming ~LKR 15,000 annual spend across 3 orders per user (~0.5% initial market penetration).

5. COMPETITIVE ANALYSIS

Direct & Informal

Competitor	Type	Their Core Strength	Mix-Trendz Advantage
Miraa	Direct	In-store physical AR hardware trial screens in select retail hubs.	Consumer mobile-first ecosystem offering personalized styling recommendations across multiple retail partner catalogs.
Single-Brand Stores (e.g., ODEL, Nolimit)	Direct / Informal	Strong brand equity, dedicated customer base, in-house inventory.	Eliminates single-brand lock-in by enabling cross-brand styling and multi-vendor aggregated cart checkout.
Social Commerce (IG/TikTok Stores)	Informal	High personal engagement and direct visual styling advice.	Provides scalable, automated AI profiling and real-time 3D visual drape preview without manual styling delay.

6. PROPOSED SOLUTION

≤ 250 Words

Mix-Trendz is an AI-powered personalized fashion marketplace that matches consumers with clothing optimized for their unique physical traits. Users create a digital profile detailing height, weight, body measurements, skin tone, and visual style preferences. The platform generates a personal 3D avatar that accurately renders partner clothing items. Users preview complete outfits, receive tailored recommendations, and checkout multi-brand orders in one unified transaction.

7. WHY THIS NEEDS AI (HONEST ASSESSMENT)

≤ 100 Words

Matching multi-dimensional body geometry and skin undertones with dynamic retail inventory requires multi-variable predictive modeling. Traditional rule-based software cannot dynamically score item compatibility, simulate realistic avatar fittings, or learn personal tastes over time. AI enables scalable, personalized styling engine automation.

8. TECH STACK & 3-WEEK EXECUTION PLAN

Implementation Roadmap

Flutter

FastAPI / Python

PyTorch (Recommendation AI)

Three.js / WebGL (3D Avatar)

PostgreSQL

PHASE	CORE DELIVERABLES & MILESTONES	TECHNICAL OUTPUT
Week 1	User profiling setup, physical metric intake forms, database schema design, and initial brand catalog integration.	Functional user onboarding & inventory database.
Week 2	3D avatar engine integration, garment mapping onto avatars, and core recommendation model v1.	Interactive avatar canvas with basic clothing overlay.
Week 3	Multi-brand aggregated checkout UI, styling algorithm refinement, end-to-end integration, and demo testing.	Fully functional MVP prototype.

9. CONFIRMED TEAM ROSTER

Locked Gate Roster

FULL NAME	ROLE / CORE RESPONSIBILITY	CORE SKILLSET & DOMAIN FOCUS
Sandes Thameesha	Lead Founder / Product Lead	Product Strategy, System Architecture & Strategic Pitching
Sahasra Janith	Software Engineer	Python Backend, Database Architecture, Payment & Brand APIs
